

LAB # 08 (b)

1. State the difference between Test Case & Test Suit

A test case is a specific scenario that is created to verify a special functionality of an application. It entails all the test procedures and the expected results as well as the operating environment. To ensure its performance is tested accurately a test case is designed to focus on a particular feature or need. Because each test case is unique it can be run independently.

On the other hand, a Test Suite is a collection of test cases grouped to test a broader aspect of the application. It helps organize multiple test cases based on related functionalities or testing objectives. Running a test suite allows testers to execute multiple test cases together, making it easier to identify issues across different scenarios. In summary, a test case verifies individual functions, while a test suite manages and executes multiple test cases together to ensure overall system stability and reliability.

2. Why you preferred Katalon over any other Automation tool available in market ? state in your words also justify your answer with suitable example

Katlon is preferred over other tools as it is user friendly and support coders as well as non coders to test the applications easily unlike other tools which rely on coding language katalon provides its pre built keyword to do all in one testing solution it provide testing various applications that are on whether desktop, or mobile app

Example : A ecommerce website has to be tested katalon provide testing it with spy record and and testing website in less time without extensive code

3. State the different Views of Katalon GUI

1. Toolbar: Contains the most common actions which you usually perform (e.g. creating test resources or executing automation tests).

2. Tests Explorer View: Tests Explorer view allows you to browse the structure of your projects and access all test artifacts quickly. Using the context menu on the view, you can create new artifacts, organize the view.

3. Editors: Editors: The editor is used to modify the detailed information of an object. Each test artifact has its own editor

4. Keyword Browser View: displays all available keywords supported by Katalon Studio. You can drag and drop the keywords here to the Test Case editor when scripting.

5. Global Variables View: Variables view allows you to browse the list of available global variables defined in your project.

6. Job Progress View: allows you to see the progress of executing test cases and test suites.

7. Problems View: shows errors and warning messages raised when you are setting up a project or designing the test case, test suite, test object or test data.

8. Console View: shows the system logs of all run-time activities performed while the automation test is being executed.

9. Report View: allows you to view detailed information of a completed test execution for a certain test suite.

4. How many types of files you can attach to Katalon ? which feature of katalon allows you to attach file in katalon test suit

Katalon allows attaching various types of files, including:

- I. Excel files**
- II. CSV files**
- III. Database files**

The Test Data feature in Katalon allows attaching files to be used in test cases for data-driven testing.

5. what is the purpose of Object Spy and Object Repository ? Explain with suitable example

Object Spy: A tool in Katalon Studio that captures and stores UI elements (buttons, input fields, etc.) from a website or mobile app.
